GNU Make Cheat Sheet

RULES

Short rules can be written as below

target(s): [prerequisites] [; shell-command(s)]

target(s): [prerequisites]

[shell-command]

%.class: %.java; javac \$<</pre>

A target pattern is composed of a "%" between a prefix and a suffix, either or both of which may

be empty.

MACROS/VARIABLES

Values assigned to variables with = are expanded when used (like a reference) while values assigned with := are expanded at declaration time. **\$(myvar)** returns the stored value and **\$(call myvar)** executes the value (like a function).

\$% The target member name, when the target is an archive member.

\$< The name of the first (or only) prerequisite.

\$? Space separated list of all prerequisites newer than than the tar-

get.

\$^ | \$+ Space separated list of all prerequisites. \$^ omits duplicate pre-

requisites, while \$+ retains them and preserves their order.

****** The stem with which an implicit rule matches.

\$(•D) | \$(•F) The path and the file name of a macro. For instance \$(@D) returns

the directory-part of **\$0**.

BUILT-IN TARGET NAMES

. PHONY prerequisites of a . PHONY target are never considered to

be up to date.

.INTERMEDIATE the targets which .INTERMEDIATE depends on

are treated as intermediate files and they are deleted once no longer needed for a

rule.

.SECONDARY the targets which .SECONDARY depends on

are treated as intermediate files but they are not

automatically deleted.

. IGNORE errors encountered while executing recipes for the pre-

requisites of . **IGNORE** are ig-

nored.

.EXPORT_ALL_VARIABLES allows vari-

ables exported in parent Makefile to be available to rules in child processes. It

INCLUDES

For large projects use several makefiles and use the command **include** to call them within your 'master' makefile. Use **-include Makefile(s)** if you don't want **make** to abort when the included Makefile's missing. The minus sign generally forces **make** to ignore errors.

FUNCTIONS

<pre>\$(subst from,to,text)</pre>	Replaces each occurrence of from in text by to
<pre>\$(patsubst pattern,replacement,text)</pre>	Replaces words matching pattern with replacement in text.
<pre>\$(strip string)</pre>	Removes excess whitespace characters from string.
<pre>\$(findstring find,in)</pre>	Search in for an occurrence of find.
<pre>\$(filter pattern_1 pattern_2,text)</pre>	Selects words in text that match one of the pattern words.
<pre>\$(filter-out pattern_1 pattern_2,text)</pre>	Selects words in text that do not match any of the pattern words.
<pre>\$(sort list)</pre>	Sorts the words in list lexicographically, removing duplicates.
<pre>\$(dir names)</pre>	Extracts the directory-part of each file name in names.
<pre>\$(notdir names)</pre>	Extracts the non-directory part of each file name in names.
<pre>\$(realpath names)</pre>	Returns an absolute name (does not contain ". or or symlinks" for each file name in
	names.
<pre>\$(suffix names)</pre>	Extracts the suffix (everything starting with the last period) of each file name in names.
<pre>\$(basename names)</pre>	Extracts all but the suffix of each file name in names.
<pre>\$(addsuffix suffix,names)</pre>	Appends suffix to each word in names.
<pre>\$(addprefix prefix,names)</pre>	Prepends prefix to each word in names.
<pre>\$(join list_1,list_2)</pre>	Join two parallel lists of words.
<pre>\$(word n,text)</pre>	Extracts the n^{th} word of text.
<pre>\$(words text)</pre>	Counts the number of words in text.
<pre>\$(wordlist i,j,text)</pre>	Returns the list of words in text from i to j.
<pre>\$(firstword names)</pre>	Extracts the first word in names.
<pre>\$(wildcard pattern)</pre>	Returns the file names matching (a shell file name) pattern (not a "%" pattern).
<pre>\$(error text)</pre>	When the function is evaluated a fatal error with the message text is generated.
<pre>\$(warning text)</pre>	When the function is evaluated a warning with the message text is generated.
\$(shell command)	Execute a shell command and return its output.
<pre>\$(origin variable)</pre>	Describes where variable came from. Do not use "\$" or parentheses around variable

values.

uses no prerequisites.

• to call them within your 'master' makefile. Use -include Makefile(s)

unless you want the name not to be constant and provide a variable reference. Evaluate text with var bound to each word in words, and concatenate the results.

Evaluate var replacing any references to \$(1),\$(2) with the first, second, etc. param

\$(foreach var,words,text)
\$(call var,param,param,...)
